

- What features were completed?
 - The login page with the sign up pop up too
 - The account page
 - Home page with the map integrated
 - Country page for the USA where it shows all the popular songs
 - Music page is functional with some songs from different countries
- What worked during the demo?
 - Everything worked
 - Home page
 - Login page
 - Register page
 - Country page
 - Music page
- What issues were faced either during the development or during the demo?
 - Git merge conflicts
 - Problems with .DS_Store when pushing and pulling the files into git
- What were the suggestions offered by the TA?
 - He told us that it would be a good idea to create a document for database structure with all the different tables and columns that we are thinking to have on the website
 - Also to make note of all the different endpoints in API back end and if there is a relationship between the tables. By doing so it makes it a lot easier to visualize and map it to the website that we build
- Individual contributions by each team member
 - Sneha
 - Worked on the login page and the account page
 - Alex
 - Worked on the music page, making it dynamically change based on an id. Also implemented the spotify preview.
 - Filip
 - Worked on the country template page and began setting up the db
 - Kelly
 - Worked on the index.html file and worked on the user interface of the homepage and the map used to navigate through different regions
 - Sultan
 - Worked on the music page making the html setup and css. Also, a dropdown search filter that shows major regions in the music page by javascript function in music.js.

- Mackenzie
 - Worked on the country page, looked into authorization for the discogs API
